The invention relates to single nucleotide polymorphisms in the human interleukin 8 receptor beta (128RB) gene. A method for haplotyping the LiBRB gene in an individual comprises identifying the nucleotide at one or more polymorphic sites and determining whether one of the copies of the gene is defined by one of the ILBRB haplotypes given in the specification or whether both copies are defined by a haplotype pair. This method is useful in genotyping, whereby all possible haplotype pair. This method is useful in genotyping, whereby all possible haplotype pair on be assigned to specific genotypes. An association between a trait and a haplotype or haplotype of the haplotype or haplotype of the haplotype or haplotype pair in a reference population, where a higher haplotype or haplotype pair. ILBRB and its corresponding DNA are used
                                                                                                                                                                                                                                                                                                      ö
therapeutic purposes. A recombinant non-human organism transformed or transfected with (1) can be used for studying expression of the PER1 isogenes in vivo, for in vivo screening and testing of drugs targeted against PER1 protein, and for testing the efficacy of therapeutic agents and compounds for disorders associated with circadian rhythm regulation. The present sequence represents an allele specific oligonucleotide primer for human PER1, which is used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; interleukin 8 receptor beta; IL8RB; ss; antiinflammatory; probe; haplotypting; haplotype pair; single nucleotide polymorphism; genotyping; gene therapy; drug screening; chronic obstructive pulmonary disease; inflammatory disease; sequencing primer; PCR primer.

for candidate drugs to treat diseases related to ILBRB activity, such as chronic obstructive pulmonary disease related to ILBRB activity, such as chronic obstructive pulmonary disease and other inflammatory disorders. The sequences are also useful for studying the effect of variation on the biological activity of ILBRB as well as on the binding affinity of candidate drugs targeting ILBRB. Sequences AASS5525-AAS95579 represent allele-specific oligonucleotide probes, sequencing primers and PCR primers used to detect ILBRB gene polymorphisms

Peptide nucleic acid probes for detection of ribosomal nucleic acid of mycobacteria - allow differentiation between species of tuberculosis complex and others and can penetrate cell membranes without pretreatment.
                                                                                                                                                                                                                                                                                                                                                             This is the nucleotide sequence of the peptide nucleic acid (PNA) probe used in the method of the invention, to detect tibosomal nucleic acid of mycobacteria. The probes are used, in situ or in vitro, for detection of the Mycobacterium tuberculosis complex (MTC), specifically M. tuberculosis, and especially in sputum samples, but also in other body fluids, blopsy specimens, foods, soil, air and water. Particularly, they are used to diagnose, stage or monitor infection, or for identification of drug-resistant strains (which generally have mutations in rNNA)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1. .15

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves relA mRNA at the nucleotide base position indicated in the DE line. The relA gene product is a subunit of the transcriptional regulator NF-kappaB and is implicated specifically in the induction of inflammatory responses. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes are designed to cleave the target sequences and thereby inhibit relA expression, making them potentially useful for treating rheumatoid arthritis, restenosis and asthma as well as for increasing tolerance to transplanted tissues. The potential immunosuppressive properties of a ribozyme that cleaves relA mRNA means that uses are limited to local delivery, acute indications or ex vivo treatment. (Updated on 25-MAR-2003 to correct PI field.)

                              Peptide nucleic acid probes for detection of ribosomal nucleic acid of mycobacteria - allow differentiation between species of tuberculosis complex and others and can penetrate cell membranes without pretreatment.
                                                                                            This is the nucleotide sequence of the peptide nucleic acid (PNA) probe used in the method of the invention, to detect ribosomal nucleic acid of mycobacteria. The probes are used, in situ or in vitro, for detection of the Mycobacterium tuberculosis complex (MTC), specifically M. tuberculosis, and especially in sputum samples, but also in other body fluids, biopsy specimens, foods, soil, air and water. Particularly, they are used to diagnose, stage or monitor infection, or for identification
                                                                                                                                                                                                                                     Gaps

differentially expresent tag sequences of transcripts that are differentially expressed in colorectal cancer, in pancreatic cancer, or in both. The tag sequences can be used to identify genes by matching the tag to a gen data base member, or by using the tag sequences as probes to isolate unidentified genes from cDNA libraries. The tag sequences can also be used in a method for diagnosing colon or pancreatic cancer in a sample suspected of being neoplastic. The method comparises comparing the level of at least one transcript in a first sample of a tissue to a being neoplastic cancer a colon or pancreatic ancer in a being neoplastic and the second sample is a colonic tissue suspected of being neoplastic and the second sample is a normal human colonic tissue. The transcript is identified by a tag selected from AAX30947-31815. The methods of the invention can be used in the diagnosis, prognosis and

This is the nucleotide sequence of the peptide nucleic acid (PNA) probe used in the method of the invention, to detect ribosomal nucleic acid of mycobacteria. The probes are used, in situ or in vitro, for detection of the Mycobacterium tuberculosis complex (MTC), specifically M. tuberculosis, and especially in sputum samples, but also in other body fluids, biopsy specimens, foods, soil, air and water. Particularly, they are used to diagnose, stage or monitor infection, or for identification are used to diagnose, stage or monitor infection, or for identification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                    drug-resistant strains (which generally have mutations in rRNA)

The tag sequences can be used to identify genes by matching the tag to a gen date base member, or by using the tag sequences as probes to isolate unidentified genes from cDNA libraries. The tag sequences can also be used in a method for diagnosing colon or pancreatic cancer in a sample suspected of being neoplastic. The method comprises comparing the level of at least one transcript in a first sample of a tissue to a second sample, where the first sample is a colonic tissue suspected of being neoplastic and the second sample is a normal human colonic tissue. The transcript is identified by a tag selected from AAX30947-31815. The methods of the invention can be used in the diagnosis, prognosis and
                                                                                                                                                                                                                                                                                                                                                                                                           Use of isolated gene transcripts - useful for developing products for the diagnosis, prognosis and treatment of cancers, particularly colon and pancreatic cancer.
                                                                                                                                                                       Transcript tag sequence increased in pancreatic and colorectal cancer.

```
The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motifi where the binding arms comprise acquences complementary to one of the substrate sequences defined in the specification. The HCV ribozymes are useful for modulating the expression and/or replication of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.
                                                                                                                                               The invention relates to an isolated, purified human nucleic acid (I) that has the same sequence as a mRNA found in humans and is a SAGE (serial analysis of gene expression) tag comprising a single stranded probe containing at least 10 consecutive nucleotides. SAGE tags, are diagnostic and prognostic markers of cancer, especially of the colon and pancreas. ABK31900-ABK32770 represent human colon and pancreatic cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Enzymatic nucleic acid, RNA cleavage, Hepatitis C virus infection, HCV ribozyme; HCV expression, HCV replication; cirrhosis; virucide; liver failure; hepatocellular carcinoma; HCV infection; drug therapy; type I interferon; interferon alpha; interferon beta; cytostatic; ss; interferon gamma; consensus interferon; hepatotropic; antiinflammatory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
New human nucleic acid containing specific SAGE tags, useful as diagnostic markers for cancer, also derived probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ä

HCV. They can be used to treat cirrhosis, liver failure and/or hepatocellular carcinoma. The HCV ribozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon, especially interferon alpha, beta or gamma or consensus interferon. The present sequence represents a RNA sequence of unknown function. Note: The present sequence is given in the sequence data but is not mentioned elsewhere in the specification. The complete sequence data for this patent was obtained in electronic format directly from the USPTO web site at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid our ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV ribozymes are useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or hepatoccellular carcinoma. The HCV ribozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      type I interferon; interferon alpha; interferon beta; cytostatic; ss; interferon gamma; consensus interferon; hepatotropic; antiinflammatory.
                                                                                                                                                                                                                                                                                                                                                                                                                            Enzymatic nucleic acid; RNA cleavage; Hepatitis C virus infection;

The invention relates to methods and compositions of detection and characterisation of nucleic acid sequences and sequence changes. One method of detection and characterisation comprises: (a) providing: (i) a folded target having a DNA sequence comprising at least 1 double stranded region and at least 1 single stranded region; and (ii) at least 1 probe complementary to at least a portion of the folded target; and (b) mixing the target and probes so that the probe hybridises to form a probe of folded target complex. Also provided are methods for determination of structure formation in nucleic acid targets; for analysing folded nucleic cide strangets, and for analysis of nucleic acid structures. The methods can be used for the detection and characterisation of nucleic acid sequences to detect the presence of pathogenic nucleic acid sequences indicative of an infection, the presence of variants or alleles of mammalian genes associated with disease and cancers, and the indicative of in paternity determinations. The methods allow simultaneous
                                                                                                                                                                                                                                                                                                                                                                                                                           ö
other drug therapies, particularly type I interferon, especially interferon alpha, beta or gamma or consensus interferon. The present sequence represents a RNA sequence of unknown function. Note: The present sequence is given in the sequence data but is not mentioned elsewhere in the specification. The complete sequence data for this parent was obtained in electronic format directly from the USPTO web site at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acid detection; nucleic acid characterisation; hybridisation; infection; disease; cancer; forensic; paternity; multiplexing; ss.

analysis of both strands (e.g. the sense and antisense strands) and are ideal for high-level multiplexing. The products produced are amenable to qualitative, quantitative and positional analysis. The methods may be performed in solution or in the solid phase (e.g. on a solid support). The methods are powerful in that they allow for analysis of longer tragments of nuclaic acid than current methodologies. The present sequence represents the sequence no:68 in the specification for which no information is provided

Detection and characterisation of nucleic acid sequences - by mixing a folded target and one or more probes to form a probe/folded target complex and detecting and characterising the complexes.

Disclosure; Page 180; 279pp; English.

The invention relates to methods and compositions of detection and characterisation of nucleic acid sequences and sequence changes. One method of detection and characterisation comprises: (a) providing: (i) a method of detection and characterisation comprises: (a) providing: (i) a conded target having a DNA sequence comprising at least 1 double stranded region and at least 1 single stranded region; and (ii) at least 1 probe complementary to at least a portion of the folded target; and (b) mixing the target and probes so that the probe hybridises to form a probe complex. Also provided are methods for determination of structure formation in nucleic acid targets; for analysing folded nucleic acid structures. The methods can be used for the detection and characterisation of nucleic acid sequences to detect the presence of pathogenic nucleic acid sequences can be used for the presence of pathogenic nucleic acid sequences of an infection, the presence of variants or alleles of mammalian genes associated with disease and cancers, and the name to the source of nucleic acids found in forensic samples,

```
The present sequence represents a polynucleotide that is able to form a triple helix with a double stranded sequence. Cytosine bases in the present can be replaced with 5-methylcytosine for increased triplex stability. The present sequence is used in the assay of the invention, where it can be part of the anchor DNA or reporter DNA sequence. The sequences to an aqueous medium containing double-stranded DNA test compared to a solid support, and reporter DNA, where either a part of the anchor DNA or reporter DNA, where either a part of the anchor DNA or reporter DNA, where either a part of the anchor DNA or reporter DNA, where either a part of the anchor DNA or reporter DNA, where either a part of the reporter DNA which is detected as an indication of structure with part of the test sequence. Triplex formation results in claplacement of the reporter DNA which is detected as an indication of the presence of the DNA test sequence. The method is a used to detect DNA captures, particularly for identification of bacteria (by detecting concogenes and Hepatitis B virus
                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Triplex formation; DNA detection; triple helix; identification; bacteria;
      as well as in paternity determinations. The methods allow simultaneous analysis of both strands (e.g. the sense and antisense strands) and are ideal for high-level multiplexing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a method for identifying oligonucleotides with desired hybridisation properties to nucleic acid targets containing secondary structure. The method comprises amplifying a target nucleic acid having at least one accessible and one inaccessible site. Primers that form an extension product are identified as the oligonucleotides which can interact with the folded target nucleic acid. Oligonucleotides from the present invention can be used in novel detection methods for clinical disgnostic purposes, including the detection and identification of pathogenic organisms (e.g. HIV). The method allows the ability to rapidly analyse nucleic acid structures. ABL46034 to ABL46367 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Identifying oligonuclectides hybridizing to nucleic acids containing secondary structure, useful in clinical diagnosis, comprises identifying primers that interact with the target to form an extension product under

                                                                                                                                                                                                                                                                           The present invention describes a method for identifying oligonucleotides with desired hybridisation properties to nucleic acid targets containing accondary structure. The method comprises amplifying a target nucleic acid having at least one accessible and one inaccessible site. Primers that form an extension product are identified as the oligonucleotides which can interact with the folded target nucleic acid. Oligonucleotides from the present invention can be used in novel detection methods for clinical diagnostic purposes, including the detection and identification of pathogenic organisms (e.g. HIV). The method allows the ability to rapidly analyse nucleic acid structures. ABL46034 to ABL46367 represent sequences used in the exemplification of the present invention
Identifying oligonucleotides hybridizing to nucleic acids containing secondary structure, useful in clinical diagnosis, comprises identifying primers that interact with the target to form an extension product under amplification conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acid analysis method associated oligonucleotide seqid 67.

                                                                                                                                                                                                                                                                                                                      The invention describes a method of analysing nucleic acids comprising providing a target nucleic acid, e.g. hepatitis C virus nucleic acid having non-contiguous single-stranded regions (NCSR) separated by an intervening region, a bridging oligonucleotide capable of binding to the first and second NCSR; a second oligonucleotide binding to a portion of clavage structure. The method is useful for analysing nucleic acids, e.g. hepatitis C virus nucleic acid useful for clinical diagnostic gurposes and detection and identification of pathogenic microorganisms such as hepatitis C virus. This sequence represents an oligonucleotide associated with the nucleic acid analysis method of the invention.
                                                                                                                                                                                                                                                              ав
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                           Analyzing nucleic acids, comprises mixing target nucleic acid such hepatitis C virus nucleic acid, bridging oligonucleotide, second oligonucleotide and cleavage agent to form cleavage structure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acid analysis method associated oligonucleotide segid 68.

The method is useful for analysing nucleic acids, e.g. hepatitis C virus nucleic acid useful for analysing nucleic acids, burposes and detection and identification of pathogenic microorganisms such as hepatitis C virus. This sequence represents an oligonucleotide associated with the nucleic acid analysis method of the invention.
                                                                                                                                                                                                                                                                                                                                                       Analyzing nucleic acids, comprises mixing target nucleic acid such as hepatitis C virus nucleic acid, bridging oligonucleotide, second oligonucleotide and cleavage agent to form cleavage structure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ds; gene; in vitro diagnosis; virus-related disease; {

                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                     The invention relates to a novel recombinant DNA (I) encoding a recombinant chimeric protein (II). The protein consists of at least two nucleotide fragments, each encoding an epitopic region of at least one microorganism; at least one sequence encoding a linker, and at least one sequence encoding a linker, and at least one sequence encoding a linker, and at least one in vitro diagnosis, especially of virus-related diseases, specifically HIV-1 or -2 infections. The protein is easy to purify and synthesise, and has strong immunoreactivity with sera from virus-infected subjects. The present sequence encodes a linker of the recombinant chimeric peptide of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Identifying nucleic acid sample source, useful for identifying bacterial strains involved in nosocomial infections, comprises treating the nucleic acid sample with components comprising a nicking agent under nicking

Intraing agent, and the Contactions cause the intraing agent. Contaction and subjecting one or more members of the family of initiating only produce a family of initiating on contact action of contact and subjecting one or more members of the process to thus provide results. The method is useful for creating an assay panel of diagnostic oligonucleotides that can identify any organism or individual. The method is useful for characterizing other DNA contactions and for characterizing cDNA expression patterns. The method is useful for identifying the source organism of a nucleic acid sample e.g., bacterium, fungus, vitus, plant, con-human animal or human. The method is particularly useful for rapidly fingerprinting DNA to identifying prokaryotic and eukaryotic species. The subspecies, and especially strains or individuals of the subspecies. It is especially useful for identifying different bacterial strains involved or in e.g., nosocomial infections. Furthermore, the method is useful for diagnosing bacterial disease in plants and humans, monitoring for bacterial contemination, monitoring manufacturing processes for bacterial contamination, monitoring manufacturing processes for contamination and/or contamination in the envisonment, monitoring processes for bacterial contamination, monitoring manufacturing processes for contamination and/or outbreaks of bacterial infections, genome mapping, contamination and/or outbreaks of bacterial infections, genome mapping, contamination and/or outbreaks of bacterial infections, genome mapping, contamination and/or eventamination in the envisor of for for the present and recombinant molecules. The invention relates to a method of treating a nucleic acid sample with components under nicking conditions, where the components comprise a nicking agent, and the conditions cause the nicking agent to nick the nucleic acid sample to thus produce a family of initiating oligonucleotide fragments to a characterization oligonucleotide fragments to a characterization confidently of initiating oligonucleotide fragments to a characterization confidently and for characterization dencile e.g., cDNA, and for characterizing other DNA confidently and for characterizing cDNA expression patterns. The method, is useful for identifying the source organism of a nucleic acid sample e.g., bacterium, fungus, virus, plant, connon-human animal or human. The method is particularly useful for rapidly fingerprinting DNA to identifying prokaryotic and eukaryotic species, subspecies, and especially strains or individuals of the subspecies. It is especially useful for identifying different bacterial strains involved in e.g., noscomial infections. Furthermore, the method is useful for identifying parter and humans, monitoring for contamination and/or contamination, monitoring quality assurance/quality control of bacterial contamination, monitoring quality assurance/quality control of contamination and/or outbreaks of bacterial infections, genome mapping, contamination and/or outbreaks of bacterial infections, genome mapping, contamination and/or outbreaks of bacterial infections, genome mapping, contamination and/or outbreaks of parterial assays, tracing bacterial contamination sites, and for monitoring agricultural sites for test crops, bacteria and recombinant molecules. The invention relates to a method of treating a nucleic acid sample with components under nicking conditions, where the components comprise a nicking agent, and the conditions cause the nicking agent to nick the nucleic acid sample to thus produce a family of initiating of process to thus provide results. The method is useful for creating an suspection of individual. The method is useful for characterization creating an sasay panel of diagnostic oligonucleotides that can identify any organism or individual. The method is useful for characterizing other DNA concluses e.g., cDNA, and for characterizing other DNA concluses of the method, kit or composition is useful for identifying the source organism of a nucleic acid sample e.g., bacteriularly useful for rapidly conn-human animal or human. The method is particularly useful for rapidly conn-human animal or human. The method is particularly useful for rapidly cin e.g., nosocomial infections. Furthermore, the method is useful for identifying prokaryotic and eukaryotic species. It is especially useful for identifying prokaryotic and eukaryotic species. Confeminal infections. Furthermore, the method is useful for in e.g., nosocomial infections. Furthermore, the method is useful for identifying duality assurance/quality control of bacterial contemination, monitoring quality assurance/quality control of tood for bacterial contamination, monitoring quality assurance/quality control of bacterial contamination, monitoring quality assurance/quality control of contamination and/or contamination in the environment, monitoring processes for contamination and/or outbreasks of bacterial infections, genome mapping, content processes of contamination and recombinant molecules. This sequence corrected and recombinant molecules. This sequence corrected and recombinant molecules. This sequence

```
The invention relates to an oligomeric compound (I) capable of modulating survivin expression, having 8-50 nucleotides and/or nucleotide analogues, where the subsequence of at least 8 nucleotides or nucleotide analogues, where the subsequence is located within a sequence chosen from one of 143 sequences given in the specification. (I) is useful for treating a mammal suffering from or susceptible from a disease caused by abnormal angiogenesis, by administering (I) containing one or most cancer, in combination with chemotherapeutic agent such as busulfan (myleran), carboplatin (paraplatin), Taxol, doxorubicin (adriamycin), etc. (I) or a conjugate (II) containing (I) is useful in the preparation of a medicament for the treatment of atherosclerosis, psoriasis, diabetic retinopathy, rheunatoid arthritis, asthma, warts and allergic dermatitis. (I), (II) or a pharmaceutical (III) containing (I) is useful for treating cancer in the form of a solid tumour, sarcoma, gloma or carcinoma chosen from malignant melanoma, basal cell carcinoma, ovarian carcinoma, breast carcinoma, non-small cell lang cancer, renal cell carcinoma, bladder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   carcinoma, recurrent superficial bladder cancer, stomach carcinoma, prostatic carcinoma, pancreatic carcinoma, lung carcinoma, cervical carcinoma, cervical dysplasia, laryngeal papillomatosis, colon carcinoma, colorectal carcinoma and carcinoit tumours. The malignant melanoma is chosen from superficial spreading melanoma, nodular melanoma, lentigo maligna melanoma, acral melanoma, and desmoplastic melanoma. The sarcoma is chosen from osteosarcoma, baing's sarcoma, chondrosarcoma, paingle should kaposi's
New locked nucleic acid containing oligomeric compound capable of modulating survivin expression, useful for treating cancer such as breast carcinoma, lung carcinoma, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Barcoma. The treatment further involves administration of a chemotherapeutic agent such as taxanes, preferably Taxol, Paclitaxel or Docetaxel. (I), (II) or (III) is also useful for preventing or limiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               apoptosis or for preventing cellular proliferation. This sequence corresponds to an antisense oligonucleotide targeted to the human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 16 BP; 1 A; 3 C; 1 G; 11 T; 0 U; 0 Other;

Sample name: ApHL3LD; Plant growth place: INRA-Rennes,
UMR Bio3P, B 3527, 35653 Le Rheu cedex, France; Soil
conditions: peat; Sowing date: 18/01/2003; Harvesting
date: 03/02/2003; Stress date: no stress; Description:
aphids inoculated on one-week old Vicia faba germinations
under non sterile conditions; experimental condition:
long photoperiod (16-hr light/8-hr dark at 18 c)"
                                                                                                                                                                                                                                                                                                                                                   /note="Vector: pCR4-TOPO; Site 1: EcoRI; mRNA was capped with oilgoribonucleotides and then used as templates for RT-PCR."
